

# There are new ways to protect you and your family from pet odor contaminants.

Hi, my name is Spot!

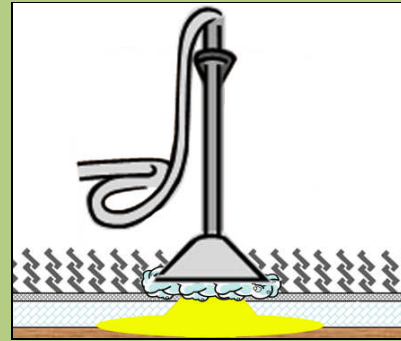

## Don't just mask the odor – remove the source

Bacterial enzyme digesters and odor enveloping polymers can aggressively attack the contaminants lurking below the surface of that pet stain.

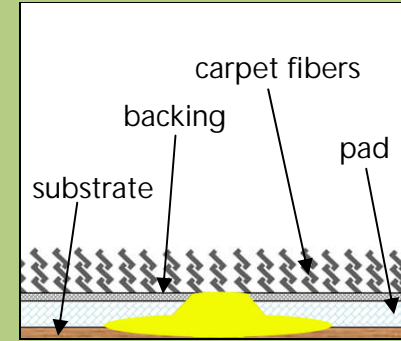

Sometimes I have accidents. Only 20% remains on the surface of the carpet.

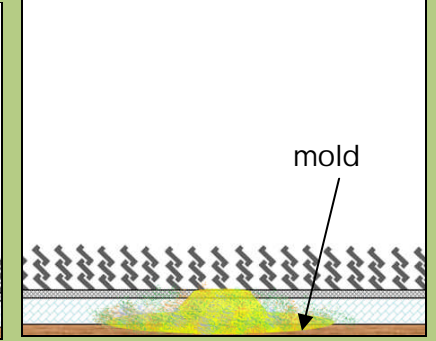

Regular carpet cleaning can't reach the 80% that soaked into the carpet pad & onto the substrate below.

The carpet fibers look clean but contaminants are still there causing damage below the surface.

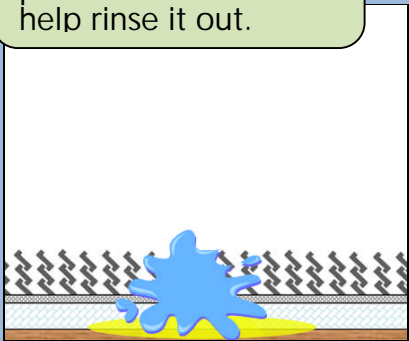

If untreated, mold can grow causing permanent damage  
**- YUCK!**

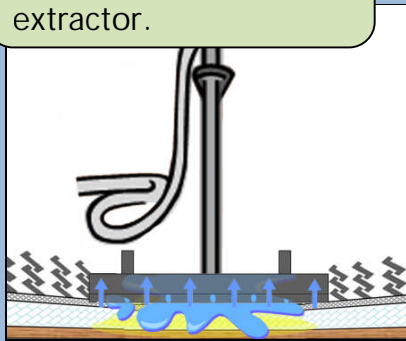

Bacterial enzyme digesters are the most effective solution to remove pet urine and other biological contaminants from your carpet. The enzymes work to break up the urine into smaller particles that can be digested by the bacteria. The bacteria are living micro-organisms that consume the broken down urine until there is none left. Odor enveloping polymers work by absorbing the source of the contaminants. They provide a protective barrier and eliminate the odor.

## Proper treatment of pet urine includes the following 4 steps:

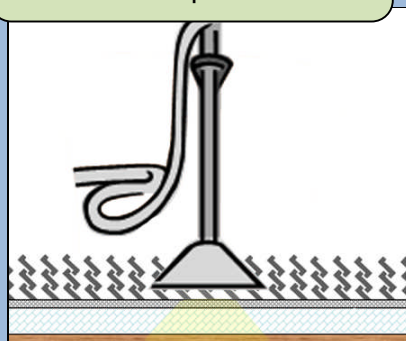

**1-Dilution:** Pouring water on it as soon as possible to dilute and help rinse it out.

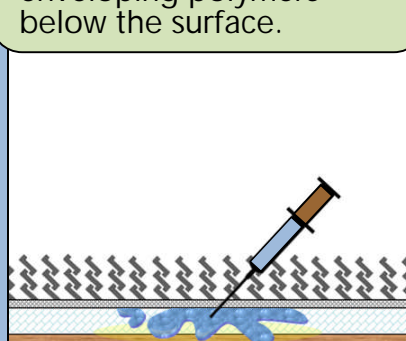

**2-Extraction:** Drawing the water out with a sub-surface flood extractor.

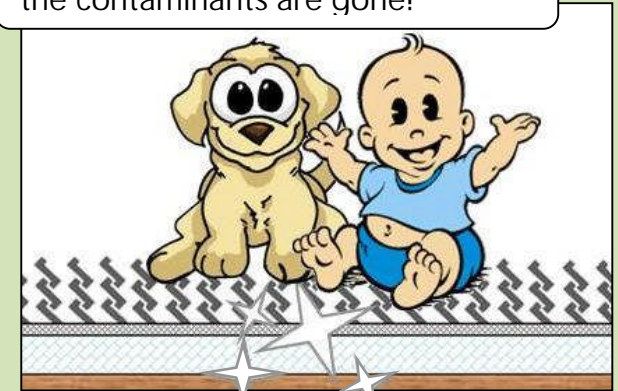

**3-Cleaning:** Removing the remaining urine from the carpet fibers.

**4-Specialty Treatment:** Injection of bacterial enzyme digesters or odor enveloping polymers below the surface.

Enjoy peace of mind knowing that the contaminants are gone!
